Primary Care of the Premature Infant

Our understanding of the management of diseases in the premature infant has changed dramatically in recent years, and it can be quite difficult to remain up-to-date on changes in this highly scientific field. Dr. Brodsky and Ms. Ouellette have worked together to create a comprehensive reference that covers both the pathophysiology and epidemiology of problems occurring in premature babies in the Neonatal Intensive Care Unit, and the management of these problems once the infant has been released from the NICU to a community practice. The book emphasizes specific diseases that affect premature infants and focuses on two primary categories: background and management in the NICU, and management of specific illnesses after discharge from the NICU. Find information quickly using an up-to-date summary of the problems that are likely to affect the premature infant. Review helpful guidelines on feeding and growth, neurologic outcomes, developmental problems, retinopathy of prematurity, bronchopulmonary dysplasia, and much more. Use easy-to-follow management algorithms to help diagnose and manage common issues in premature infants after discharge. Make effective decisions about screening, immunizations, counseling of parents, and more.. Help families deal with the emotional impact of caring for a premature infant.. Access a list of disease-specific websites for clinicians and families.

Practical Child and Adolescent Psychiatry for Pediatrics and Primary Care

Pediatricians and primary care providers (PCPs) commonly encounter youth with mental health problems in their practice. The aim of this practical handbook is to facilitate the triage, differential diagnosis, treatment, and referral of youth in an efficacious and safe manner

Proceedings of 20th International Conference on Pediatrics & Primary Care 2018

The purpose of this book is to provide a children's mental health resource tailored to the needs of physicians working with children. There are currently no such texts, despite the fact that there are patient care, healthcare systems, and workforce factors that indicate a strong need for such a resource. Approximately 1 in 5 children are diagnosed with a mental illness by the age of 18. Additionally, mental health conditions, including Attention Deficit Hyperactivity Disorder, are consistently among the most common chronic conditions in pediatric clinical populations. Delays in both diagnosis and treatment increase the morbidity associated with these conditions. These delays expose the child to negative ramifications of his/her

illness and can impact rates of poor academic performance, substance use disorders and criminal justice system involvement – potentially impacting long-term life trajectories. Early identification of mental illness and appropriate intervention is critical to the healthy development of youth, though physicians in primary care and pediatrics are seldom trained to detect and treat such illnesses. The importance of recognizing mental illness is reflected in practice guidelines for pediatric primary care providers as well as in how service delivery is being structured, but this does not offer in-depth clinical guidelines. Additionally, integrated care and medical home models include mental health as key components, though yet again physicians are often not trained to work with these models. While clearly indicated clinically, these requirements do not come with significant increases in reimbursement and are added to an already demanding schedule. Increasingly, providers are also expected to use evidence based screening instruments without exposure to this body of literature. Some guidance on using those instruments in context will help them to use those tools more effectively. Finally, primary care providers and even some adult psychiatrists and psychologists are operating in a healthcare system with a severe, nationwide shortage of child and adolescent psychiatrists and mental healthcare providers. While a text certainly cannot single-handedly compensate for such a workforce shortage, it could potentially help to mitigate the negative impact on patients by facilitating early identification and treatment in the primary care setting. Additionally, with more effective treatment in pediatric settings, less complex cases may be addressed before specialty care is needed, and the expertise of child and adolescent psychiatrists can be more effectively used for more complex cases. *Pediatric Psychiatry in Primary Care* is the ultimate resource for clinicians working with children, including pediatricians, family physicians, general psychiatrists, psychologists, early career child psychiatrists, social workers, nurses, school counselors, and all clinical professionals who may encounter children struggling with psychiatric disorders.
