The Biological and Social Determinants of Child Development stimulates cross-disciplinary communication and research collaboration in the field of child development. While the papers in this issue seem diverse in terms of topic and discipline, there are a number of common themes: \*critical period for brain

development and the importance of specific environmental input during this period; \*importance of early brain development and enriched environments is supported in articles describing findings from human studies; \*potential for brain plasticity following specialized retraining is found in a compelling paper demonstrating different profiles of brain activation for normal readers vs. those who have dyslexia and younger children at high risk for development of reading disabilities; and \*critical period, brain plasticity, and parallel changes in developing behavior and brain structure and functioning. As a number of papers in this issue describe potential interventions, one is relevant because it describes the numerous factors that make results of such studies have the potential to generalize to larger populations. Putting the described papers in a broad perspective, the last article argues that we cannot understand the health status of a society without understanding the health-determining influences across the life course.

Principles and Practice of Restorative Neurology is a collection of topics in clinical neurology where progress through research has brought concepts of patient management. The collection emphasizes research done clinically and in experimental laboratories and attempts to discuss restorative neurology in the larger context, encompassing biology, neurobiology, and rehabilitative engineering. The book discusses the concept that neurology should be more therapeutic instead of being just diagnostic because of advances in techniques and drugs. An epidemiology of disability and the evaluation of restorative neurology are explained. The text also presents the developments in the pharmacotherapy of major neurological disorders, such as Parkinson's disease, dementia, and stroke. The use of biomechanical or rehabilitation engineering to treat impaired or lost functions in a patient is compared; the feedback mechanisms and the kinds of

treatment including microsurgery, neurostimulation methods, surgery, and molecular genetics that are applied to specific disorders are discussed extensively. The book also reviews the approaches of gene correction for disorders in the central nervous system. Finally, the future needs of neurology in terms of diagnosis and treatments are dealt with as more research, techniques, and drugs are being discovered and proved useful. The collection is intended for neurologists, neurologists in training, and other physicians whose work lies with neurological disorders. The book can also prove useful for practitioners and academicians in the fields of neurosurgery, internal medicine, psychiatry, and rehabilitation medicine.

Increasing evidence identifies the possibility of restoring function to the damaged brain via exogenous therapies. One major target for these advances is stroke, where most patients can be left with significant disability. Treatments have the potential to improve the victim's quality of life significantly and reduce the time and expense of rehabilitation. Brain Repair After Stroke reviews the biology of spontaneous brain repair after stroke in animal models and in humans. Detailed chapters cover the many forms of therapy being explored to promote brain repair and consider clinical trial issues in this context. This book provides a summary of the neurobiology of innate and treatment-induced repair mechanisms after hypoxia and reviews the state of the art for human therapeutics in relation to

lifesaver, with indispensable information on the prevention, symptoms, diagnosis, and treatment of our number one killer disease." "Each of the twenty-nine chapters was written by a member of Yale's distinguished medical school faculty and staff. In clear, understandable language they provide answers such as how to recognize critical warning signs (and take preventive action) before a heart attack strikes, how to live a normal life after a heart attack, how to modify your diet to lower cholesterol and lose weight without destroying the pleasure of eating, and how to manage stress in today's anxiety-ridden world." "There are special sections on tests and procedures as well as chapters on heart disease in women, the elderly, and children and young adults. A quick reference "Encyclopedia of Common Heart Disorders" provides at-a-glance descriptions of each medical problem, as well as its diagnosis, treatment, and prevention." "Also featured is a full-color atlas of the cardiovascular system and more than two hundred illustrations, charts, and tables. The Yale University School of Medicine Heart Book is truly the one reference guide every family needs to be fully informed about maintaining a healthy heart."--BOOK JACKET.Title Summary field provided by Blackwell North America, Inc. responses to some of the most common. This book describes and discusses the increasing public health impact of common neurological disorders such as dementia, epilepsy, headache disorders, multiple sclerosis, neuroinfections, neurological disorders associated with malnutrition, pain associated with neurological disorders, Parkinson's disease, stroke and traumatic brain injuries. It provides information and advice on public health interventions that may reduce their occurrence and consequences, and offers health professionals and planners the opportunity to assess the burden caused by these disorders. The clear message that emerges is that unless immediate action is taken globally, the neurological burden is likely to become an increasingly serious and unmanageable.

The spinal cord is a long structure, consisting of white and grey matter, that not only serves to provide a neural connection between the brain and the body, but also contains neural circuits that are organized segmentally and that are responsive to central and peripheral sensory input. Thus the spinal cord is capable of some behavioural activity that is of clinical significance, and that is more evident when higher modulation is disturbed. The released activity of spasticity, and the disturbances of bladder and bowel control that occur in patients with spinal cord lesions are examples. The spinal cord is well protected within its bony canal but is, nonetheless, susceptible to compression by degenerative joint or bone disease, or by neoplasm. Spinal cord compression is a common clinical problem that is not always easy to recognize. However, it is particularly important because of the good results of appropriate treatment and the unfortunate consequences should the diagnosis be missed. Many other medical and surgical disorders affect the spinal cord, including vascular disease, decompression sickness, degenerative disorders and multiple sclerosis. In this book Dr. Critchley and Dr. Eisen, and their col

Most neurological disorders are chronic and aging-related. With the increase of life expectancy their incidence and prevalence will grow in the decades to come, which in turn will increase the load on medical and social systems worldwide. There is thus a desperate need for successful preventive and therapeutic measures based on randomized clinical trials (RCTs) conducted by independent organizations. This book provides a compendium relating most of the principles of reliable RCTs to specific neurological diseases. Contributed by specialized neurologists, the articles touch on important aspects of RCTs with a clear critical approach, highlighting their limitations as well as giving recommendations for their planning and conducting to

This volume is based on the proceedings of four full day Main Theme Symposia held during the XIV World Congress on Neurology', 22-27 October 1989 in New Delhi, India. The contributions, submitted by internationally renowned scientists, review the current state-of-the-art on specific, compelling problems encountered daily in neurology. The book is divided into five sections, each of which assumes a different topic as its focal point. The first section deals with Cerebrovascular Disease (CVD), and is devoted to both acute and chronic CVD. CVD was the main theme eight years ago during the XII World Congress of Neurology in Kyoto and since then many new developments have taken place relating to the diagnosis and management thereof. Among topics discussed are epidemiology, mechanism of cerebral ischaemia and medical management of acute stroke, and areas pertaining to stroke-in-young, including acute cerebral venous occlusions and arterial strokes. AIDS, the twentieth century plague is spreading uninhibited throughout the world and continues to attract the attention of neuroscientists because of its numerous
