Homoeopathic Therapeutics

The management of foot disorders in diabetes requires the expertise of a wide range of specialists, including physicians, surgeons, chiropodists and nurses in addition to diabetologists. This book attempts to define the minimum requirements for a diabetic foot service. For example, how many chiropody sessions are needed per week in a given health region? What facilities are required, and what equipment? Who should teach patients how to look after their feet, and how much time should be devoted to this? How can patients at risk be identified? How often should patients be screened for evidence of neuropathy or peripheral vascular disease? What would be the costs of a comprehensive foot service, and would the results justify the expense?

Clinicians often believe they are too busy taking care of patients to adopt and implement patient safety initiatives and that acknowledging medical errors is an affront to their skills. Patient Safety provides clinicians with a better understanding of the prevalence, causes and solutions for medical errors; bringing best practice principles to the bedside. Written by experts from a variety of backgrounds, each chapter features an analysis of clinical cases based on the Root Cause Analysis (RCA) methodology, along with case-based discussions on various patient safety topics. The systems

and processes outlined in the book are general and broadly applicable to institutions of all sizes and structures. The core ethic of medical professionals is to “do no harm”. Patient Safety is a comprehensive resource for physicians, nurses and students, as well as healthcare leaders and administrators for identifying, solving and preventing medical error.

"The Comprehensive Manual of Therapeutic Exercises: Orthopedic and General Conditions was written as a fundamental resource on exercise theory and techniques, and as a comprehensive guide for designing exercise programs. Dr. Elizabeth Bryan has compiled thousands of clinically relevant exercises to create a text that will teach students theory and proper application that they will then return to again and again in their career as a reference to aid in designing evidence-based exercise programs for their clients or patients. Introductory chapters cover exercise parameters, exercise progression, the importance of form, muscle soreness, and a reference for body position terminology, then subsequent chapters are organized by body area to cover most of the clinical exercises in use today. Each exercise includes photographs, a list of muscle systems that will be affected, specific substitutions to look for, and detailed instructions directed at students and clinicians. Also included are sections devoted to protocols and specialty exercises including yoga and tai chi"--Provided by publisher.

The Comprehensive Manual of Therapeutic Exercises

Public and political concern about the increasing prevalence of diabetes has prompted major concern about treatment of patients with the condition. Foot

complications are some of the commonest causes of hospitalisation of people with diabetes and if not treated well often lead to amputation. There is evidence that 85% of these amputations can be prevented by better understanding of the problem and by multi-disciplinary teams working more effectively together. This has been recognised and NICE have recently published guidelines on diabetic foot complications as have Diabetes UK and NHS Diabetes. These have been successful in raising awareness of the problem but the local multi-disciplinary teams need clear practical advice on how to manage the foot in diabetes and deliver high quality care. With the current interest in improving outcomes for patients with foot complications this is an ideal time to make a practical evidence-based handbook available. This book will provide clear practical guidelines on how to manage all aspects of the foot in diabetes as well as an in-depth analysis of the most recent evidence. The book will be based on care pathways with algorithms for each section so it would be of practical value in any clinic in primary or secondary care. It will appeal to a wide range of health care professionals treating people with diabetes: vascular surgeons and trainees, orthopaedic surgeons, diabetes specialist nurses, podiatrists and tissue viability nurses.
